a login ups sorry good luck I mean "purge" and dpkg-reconfigure rfid didn't help, or any other option (what to try next). I've been troubleshooting this for a while. I reinstalled the OS with the latest version of gdm. It looks like something between some update and the new gdm caused this. I have had no problems since. kamikaze2000: wich ubuntu version? 18.10 It's a zad6c5k2 !info linux-image-generic bionic linux-image-generic (source: linux-meta); Generic Linux kernel image. In component main, is optional. Version 4.15.0.106 (bionic), package size 2 kB, installed size 15 kB but it was a dev version, not a final I am going to try installing gdm from a xenial version. I see a lot of old stuff on a removed page. I can live with that if needed. Installing 16.04 would be my backup plan. It would be a dirty trick but I would do it if I cannot get it working. kamikaze2000: can you still perform sudo apt-get upgrade? Yes. kamikaze2000: after you upgraded to latest? It says that 0 are new. None. 0 upgraded, 0 newly installed, 0 to remove and 0 not upgraded. kamikaze2000: ok, try sudo apt install gdm I think that may have fixed it. I cannot promise anything because f3e1b3768c
