AutoCAD History An Autodesk employee, John Warnock, invented the software that became AutoCAD in 1968, when he was working at Electronic Data Systems (EDS). He worked on the "drawing order" concept and named the product MicroCAD. In 1969, he was joined at EDS by fellow employee Bob Frankston, who developed the "character set" concept, and the company later purchased his share of the idea. Warnock and Frankston formed the company Autodesk with a group of fellow engineers. When Autodesk was formed in 1972, Warnock and Frankston each received 25% of the company, and the other co-founders each received 10%. In 1974, the company started marketing and selling its first software product, an interactive geometry and drafting application called MicroDRAW. In 1983, the company created AutoCAD as an enhanced version of MicroDRAW, with an interface that was more like a CAD system, and AutoCAD was released to the public in December 1983. AutoCAD I AutoCAD I was an application that only ran on PC microcomputers and was sold as a full-featured desktop system that sold for $3,995. An AutoCAD I station could display multiple documents in a user's drawing area. The software was licensed as Autodesk Product Number ACDLB, and the software, disk, and manual came in a cardboard box that could be stored at the user's site. The basic drafting tools were typically found on the keyboard. The included three-button mouse permitted the mouse buttons to control the object's rotation and moving. Three buttons on the mouse were for left, right, and middle clicks, which selected from different options. Two buttons on the mouse were used to scroll up and down and left and right in the drawing. There was no menu system, and objects could be activated by pressing the ALT key. Pressing the ALT key made a double-sided arrow appear over the cursor, which could be used to select and move objects. The first wave of office automation technology, known as microcomputers, was introduced in the early 1970s. They used a series of integrated circuits and required software that ran on them. This included both drawing packages and the software that enabled the user to interact with the computers. Microcomputers typically cost from several hundred dollars to several thousand dollars and could either be purchased or leased. They were

What's New In AutoCAD?

Text Simplification: Combine multiple text styles into one with the new simplified text style feature. Previously, if you needed to customize the shape of the font, you had to create your own drawing. Now you can create your own text style that applies to multiple objects. (video: 1:47 min.) Simplify and Solidify: Simplify and solidify the edges of objects to reduce vector editing, while the new parallel surface tool can simultaneously create top and bottom surfaces. (video: 1:07 min.) Geometric Calc: You can generate accurate custom paths and work with formulas to extract parts of a path for use in other drawings. (video: 2:05 min.) Active View: You can now access the display area of your drawings with any tool. (video: 1:01 min.) Markup assist If you think about drawing a line, you think about the ends of a line. You also think about other objects around the line. So if you have a line, it's just that end and the thing that's around it. That's how your mind works. When you think about lines in AutoCAD, you think about four different things: the start, the end, the endpoint, and the connection point between them. If you think about it that way, all your lines are much shorter, cleaner, more compact. What we've been working on is something we call markup assist, and it simplifies the way you think about your lines. You can start with one line, and as you go down the line, it will tell you where the start is, where the endpoint is, and where the connection point is. We call the new feature "Markup assist". To markup assist, go to the home tab and select markup assist from the shortcut menu. Once you start marking up, the first thing you'll notice is that you can drag around with the cursor, and as you drag, you'll see a marker around the lines. The new feature is really easy to use. You can start marking up the line with your mouse or a command, and when you're done, you can go back and press Esc or hit spacebar or another key to release the mouse. Then, the marker tells you where the endpoint is, and then the
