Brushes are one of the most popular tools in Photoshop. They can be used for various effects, including compositing, painting, erasing and retouching images. The Clone Stamp allows you to copy pixels from one area of an image and paste them into another area. This is useful for repairing damaged or corrupt images. The Warp tool allows you to change the orientation of the image, stretch or distort it. **Q:** Add Subpages into Static webpage having WordPress I have a website built using wordpress. I have it all setup, but I want to add

---

a navbar that uses links to go to subpages of the existing website. How would I go about doing this? A: There's multiple approaches to this, but if you want something custom, I'd recommend the Look Book solution plugin. It allows you to build out the look and feel of the webpage within the admin area, and have the look translate into what you see on the front end. The present invention is concerned with plasma impingement ion sources, and more particularly, with an ion source for use in ion implantation systems, and which creates a plasma condition which has a net positive charge on the wafer being implanted. In the semiconductor manufacturing art, ion

---

implanters and ion sources are used to dope semiconductor wafers with impurities to create semiconductor devices. Ion implanters are used to ionize a material to be implanted in an ion source and then accelerate the ions to high energies using an ion beam, typically in the range of hundreds of keV's. The ions are mass analyzed to eliminate undesired ion species, and then the beam is directed at the surface of the semiconductor wafer, which performs the desired doping. FIG. 1 is a schematic diagram illustrating a conventional ion source 2. Ions in a neutral ion beam 4 are created by one or more sources 6, typically a hot filament or filament-like source 6a, which

---

is heated to create a plasma or a portion of a plasma. In the case of a hot filament, a filament is heated by passing a current through it. In the case of a cold filament, an electron beam is used to heat the filament. In both cases, a large percentage of the current supplied to the filament goes into heating the filament rather than producing any ions, and is in any event not usable for production of ions. The plasma is typically confined within a source region 8 which is within the source 6, and has an arc shaped cross-section. The ions are extracted from the source region 8 by a positively biased extraction aperture 10, which is made of or coated with a material that is

---

sufficiently positive relative to the plasma that the flow of ions towards the aperture is greater than the flow of electrons away from the aperture. The positively biased extractor 10 draws ions away from the source and accelerates them
