With the introduction of AutoCAD, the use of CAD software went from a niche product to a mainstream technology. The software soon eclipsed competing products, including some of the most widely used software packages, such as Macromedia's Flash and Microsoft's Visio. AutoCAD now runs on the majority of desktop computers worldwide and is the most widely used CAD program on the market. AutoCAD provides the functionality of traditional drafting programs, such as mechanical drafting, architectural drafting, construction drawing, technical drawing and mechanical design. AutoCAD can be used to model and render a wide variety of three-dimensional (3D) objects, including product designs, architectural designs, mechanical designs, drawings for drawing up contracts, and technical designs. AutoCAD can be used as a traditional 2D or 3D drawing program, for editing existing drawings and for creating new ones. It is also used as a specialized CAD application for engineering, architectural, mechanical and construction drafting, which uses parametric modeling, complex drawing, specialized features and traditional 2D drafting. AutoCAD is also used by artists, landscape architects, industrial designers, fine-art drafters and others. AutoCAD Features AutoCAD offers a variety of features that can be used to achieve different types of tasks. Some of the most important features are as follows: Design Parametric Modeling: The creation of models and drawings using parametric modeling allows users to build 3D models that are manipulated as 2D surfaces. It is possible to add, delete, rotate, scale, and mirror 3D objects as well as create 2D details and surfaces from within the 3D model. For example, a company's logo can be drawn as a 3D object, then replaced with a 2D surface. Parallel Coordinate Systems: AutoCAD provides two types of parallel coordinate systems: AutoCAD LT: The Classic Parallel Coordinate System (CPCS) is the default coordinate system for AutoCAD. It is a coordinate system that supports a 2D Cartesian (x, y) coordinate system, and a parallel coordinate (x1, x2, y1, y2) system. AutoCAD Cracked Accounts architecture, also called a CAD model, is the underlying structure and entities of a CAD model. A CAD model has a number of entities. The most basic entity is a drawing, a model view or section view. Drawings have dimensions and can be assembled into a drawing package (a bundle of drawings). Models are used to define the geometry of a work item, and drawings are used to display the result. Section views are used to define the view of a part of a model. Section views are also used to specify an operation, such as adding, subtracting, or intersecting two or more sections.

CAD software can be classified into many sub-types, including Drafting, Inspection, Design, Database, Reverse Engineering, Rendering, etc. Design tools Design tools are CAD programs that allow users to design three-dimensional objects. The designer draws, edits, and modifies a model to form his or her intended design. Some types of design tools allow the designer to operate on multiple parts of the same model at the same time. The model can then be exported to an output device for printing or creating a drawing. CAD files can be transmitted or shared via networks. Some CAD software can be used for tasks beyond basic design, including animation, mapping, and rendering. 3D Modeling 3D Modeling is the process of creating three-dimensional objects using a computer. Unlike traditional drafting tools that are used to create 2D drawings and plans, 3D modeling is widely used in architectural and engineering projects. 3D models are used to create fabrication or manufacturing designs, and are often integrated into project management software. These models can be exported as a graphical image (e.g., a mesh), or as a geometry (e.g., as a linear or surface model). Related concepts With AutoCAD, CAD software has many features that do not fall neatly into any one category. The following list categorizes common features. Concepts that are similar to CAD include modelling, geometrical design, and visualization. Thursday, November 15, 2014 The Best Way to Keep a Mate Happy and Satisfied The best way to keep a mate happy and satisfied is to surprise him with a set of homemade cards and gifts on birthdays and anniversaries. Sending a special card on a birthday card is a thoughtful, romantic and loving way of saying "Happy Birthday". While, if you are looking for a gift, a homemade card is a creative and very thoughtful way of showing your love and appreciation. Here is a fun idea to make at home: * Find some colored cardstock, address and envelopes. You can get these items at your local craft store or pick them up from the dollar store. * Use a pad of graph paper. The graph paper is available at Staples or Michael's for around $1.00 a pack. Use one for each picture you plan to create. * Find a picture that is special to your mate. Use your imagination and have fun with this. It can be a photograph, drawing, photo collage, cartoon, or any other picture. If you are feeling lazy, print out a photo from Google or Picasa. * Print out your picture on graph paper. Your first step is to trace the outline of your picture. If you are using a photo, then you might need to use a marker or pencil to shade the edges of the picture before you print. * Use a sharpie marker to decorate the picture. * Once you have decorated your picture, print it out on graph paper. * Cut out your picture and make your card with cardstock. If your are using colored cardstock, fold the picture in half and cut out the back of your picture. If you are using white or neutral colored cardstock, then just fold your picture in half and cut out the back of your picture. * Address your card and seal it in the envelope. Here are
